

Centrifugal Fans and Blowers

Double Inlet

Double Inlet, Double Width Fans

A range of ten standard models designed specifically for applications where low noise levels are critical. Resiliently mounted low speed motors coupled with large fan outlets provide low air velocities – the main contributor to quiet running fans.

For installations where higher resistances to flow need to be overcome some versions are available with higher speed motors to generate more pressure capability.

The fans are normally mounted from their outlet flanges which can be for either vertical or horizontal discharge.

General Installation Conditions

These fans are suitable for handling ambient temperatures up to 40°C. and should be fitted with the motor shaft horizontal. If this temperature is exceeded there is a risk of the motors overheating and triggering the in-built thermal protection devices.

The fans must not be used for handling explosive, inflammable or corrosive gases, nor sited in such environments.

Typical applications

Widely used in air conditioning units, heat recovery, VAV boxes and smaller air handling units.

Specifications:

All models feature multivane impellers manufactured from aluminium or mild steel housed in cases fabricated from mild steel. Permanent capacitor motors have been specified for this range (except the 57FTQR) for their comparative efficiency and better speed & noise control.

Outlet flanges with fixing holes for ease of installation are integral on each model.

Whilst the 57FTQR is offered with flying leads for electrical connection the rest of the range have pre-wired capacitors mounted on the fan case side together with a terminal block.

Speed Control

All models offer a good range of speed controllability by voltage variation.

Maintenance

Very little servicing is required. The motor bearings are "sealed for life" and no provision is made for re-lubrication. It is recommended that the impeller is carefully cleaned annually, or more frequently where dusty conditions prevail.

Variants for OEM Applications

The fans described here can be supplied in any quantity with some ex-stock capability (please contact Customer Services for availability) However, where Original Equipment Manufacturers require non-standard features for their application, modifications to the standard designs can be offered when production quantities exceed, typically, 100 off. Examples of possible variations are:

- fitting motors for non standard voltages.
- variations to the outlet flange, or no flange.
- opposite hand rotation.
- inlet guards, spigots & spigotted guards.
- use of non standard impeller diameter/width combinations to meet specific performance requirements.
