

The Oventrop Quality Management System is certified to DIN-EN-ISO 9001

#### Tender specification:

Oventrop wafer pattern butterfly valves (DN 50 up to DN 300) for installation between two flanges according to DIN EN 1092-2 (PN 10 or PN 16) and lugged pattern butterfly valves (DN 50 up to DN 400) for installation between two flanges according to DIN EN 1092-2 (PN 10 or PN 16 for DN 50 up to DN 200; DN 250 up to DN 400 only for PN 16).

1. PN 16, -10°C up to +110°C with EPDM liner.  
For water or mixtures of water and ethylene or propylene glycol.
2. PN 16, -10°C up to +80°C, with NBR liner.  
For water, mineral oils, air, harmless gases (not suitable for aggressive or flammable gases like gas installations according to TRG).

Body made of nodular cast iron GJS-500-7 (GGG 50)

Stem made of stainless steel AISI 410

Flap made of stainless steel CF8M AISI 316

Loose liner made of EPDM or NBR (depending on the application)

O-ring seal of the stem for DN 50 up to DN 300

The butterfly valves must only be used with fitted blind flange as terminal valve.

#### Advantages:

- Compact construction
- Quarter turn operation of the lever for a quick isolation of the pipework
- Snap-in lever
- Installation in any position
- Low pressure loss due to centrally mounted flap and flow-supporting construction
- Extended stem for an easy insulation of the pipework

#### Function:

Oventrop butterfly valves are installed in the risers of hot water central heating or cooling systems.

Due to the special construction of the butterfly valves, the isolation function is given even where space is limited.

The internal loose liner guarantees a safe sealing of the fluid against the shaft conduit and the flanges.

Additional counter flange seals are not required. The fluid only comes into contact with the flap and the liner.

| Size:  | kvs value: | Item no. :* |

## Installation advice:

Before installation please make sure that the surfaces of the flanges comply with DIN EN 1092-2 standard (PN 10 or PN 16) and that they are installed in parallel with a sufficient distance to each other.

An exact alignment of the Oventrop butterfly valves with the flanges is very important:

- Full utilization of the sealing surface between butterfly valve and flange
- Avoid damage of the inside flap during opening

Open butterfly valve slightly before installation.

When tightening the screws of the flange, the butterfly valve must be opened completely to make sure that the initial torque when opening the valve is not too high due to the deformation of the loose liner.

Additional flange seals are not required.

Tighten screws crosswise.
